wysdym

RESEARCH ROUNDUP · UPDATED NOVEMBER 2026

52 agentic AI statistics *every GTM leader* should know in 2026

Agentic AI crossed from demo to deployment. These 52 statistics show where the market really stands. We've organized them around the five pillars that separate production agents from prototypes: **learning, skills, connectivity, governance, and observability**.

RC **Rob Catalano** · Co-Founder, wysdym | Last updated: November 9, 2026 |

Every stat links to its original source

Live, always-current version with clickable sources: https://gtmstats.wysdym.ai

$2.59T

Worldwide AI spending forecast for 2026 — up 47% in a single year. *(Gartner)*

62%

Of organizations are building, deploying or developing AI agents — up from 53% a quarter earlier — and multi-agent work jumped from 6% to 25%. *(KPMG)*

14%

Of teams ship agents with full security and IT approval — while 81% are already past planning. The five pillars below decide which side of this stat you land on. *(Gravitee)*

Every team is buying agents. No one is building the layer underneath.

MAJOR TAKEAWAYS

If you only read four things

Deployment is mainstream. Depth is rare.

62% of organizations are now building or deploying AI agents and AI took over 70% of Q2 2026 venture funding — yet only 22% have scaled AI across multiple business units, and just 16% of enterprise deployments qualify as true agents.

The failure mode is knowledge, not models.

Agent task capability nearly quadrupled in a year — but 95% of organizations still get zero return from GenAI. MIT's diagnosis: systems that don't learn, don't retain context, and don't improve with use.

Governance became the deciding vote.

Human validation of agent outputs nearly tripled in a year (22% → 63%), yet only 14% of teams ship agents with full security and IT approval — and 88% of organizations report confirmed or suspected agent-related incidents.

Visibility is the trust currency.

89% of agent teams run some observability — 94% of those in production — but roughly 3 in 10 still don't evaluate their agents at all, while documented AI incidents rose 55% in 2025.

WHAT'S IN THIS REPORT

01 Market size & momentum

02 Adoption & implementation

03 The five pillars framework

04 Pillar 1 — Learning & knowledge

05 Pillar 2 — Skills & capabilities

06 Pillar 3 — Connectivity

07 Pillar 4 — Governance & trust

08 Pillar 5 — Observability

09 ROI, outcomes & what's next

10 What this means for GTM teams

11 FAQ

12 Methodology & sources

SECTION 01

Market size & momentum

The agentic AI market stopped being a forecast and started being a budget line. Here's how big it is, how fast it's growing, and where the money is going.

STAT 01

$2.59T

Worldwide AI spending will hit $2.59 trillion in 2026 — up 47% in a single year

Gartner's May 2026 forecast has AI software alone growing from $282.9B in 2025 to $453.2B in 2026. The budget debate is over; the execution debate is just starting.

Gartner, May 2026

STAT 02

$1.3T

AI spending grows 31.9% a year through 2029 — reaching $1.3 trillion

IDC pins the growth squarely on agentic AI — applications plus the systems needed to manage "agentic fleets" — exceeding 26% of all worldwide IT spending by 2029.

IDC, August 2025

STAT 03

$581.7B

Global corporate AI investment reached $581.7 billion in 2025 — up 130% year-over-year

Private AI investment hit $344.7B (+127.5%), and US private investment ($285.9B) ran 23x China's ($12.4B), per Stanford's 2026 AI Index.

Stanford HAI, 2026 AI Index, April 2026

STAT 04

$510B

Global venture funding hit a record $510 billion in H1 2026 — with AI taking over 70% of Q2 capital

H1 2026 topped all of 2025 combined, and OpenAI plus Anthropic alone raised $217 billion — 43% of all H1 startup funding. Investors aren't hedging on the agent thesis — they're concentrating on it.

Crunchbase News, July 2026

STAT 05

$37B

Enterprises spent $37 billion on generative AI in 2025 — 3.2x the year before

The largest share, $19B, went to the application layer — the agents and AI products teams actually use — per Menlo Ventures' enterprise survey and market model.

Menlo Ventures, December 2025

STAT 06

$450B

Agentic AI could drive ~30% of enterprise application software revenue by 2035 — over $450 billion

That's Gartner's best-case scenario, up from 2% in 2025. Even the conservative read makes agents the defining software category of the next decade.

Gartner, August 2025

SECTION 02

Adoption & implementation

Nearly every enterprise is experimenting with agents. Far fewer have them in production — and the gap between piloting and scaling is where most of the story lives.

STAT 07

62%

62% of organizations are building, deploying or developing AI agents — and multi-agent work jumped from 6% to 25% in one quarter

KPMG's Q3 2026 Pulse (314 leaders at $1B+ companies, fielded July–August 2026): agent activity rose from 53% to 62% in a single quarter, and the share actively developing or implementing multi-agent systems climbed to 25%, from 6% in each of the two prior quarters. Single agents were the pilot. Coordinated fleets are the program.

KPMG AI Quarterly Pulse, September 2026

STAT 08

40%

40% of large organizations are scaling AI agents — up from 27% a year ago

Among smaller organizations the share stayed flat at 22%, and across all respondents only about two in ten have reached the scaling phase with agents. McKinsey's 2026 survey (1,719 participants, fielded May–June 2026) shows the gap between "trying agents" and "running on agents" is closing — but mostly at the top of the market.

McKinsey, The State of AI in 2026, August 2026

STAT 09

22%

Only 22% of organizations have successfully scaled AI across multiple business units

Gartner's survey of 1,303 respondents (January–April 2026) found investment racing ahead anyway: 85% of functional leaders plan to increase AI spending in 2026, and roughly 11% don't even know what their function spent on AI in 2025. The gap between pilot and scale is rarely the model — it's the operating layer underneath it.

Gartner, September 2026

STAT 10

40%

40% of enterprise applications will ship with task-specific AI agents by the end of 2026

Up from less than 5% in 2025. Agents are becoming a feature of software you already own — which raises the bar for the layer underneath them: the shared graph, skills, and governance every one of those agents has to run on.

Gartner, August 2025

STAT 11

13%

Only 13% of CIOs say their enterprise has realized significant or transformational value from AI

Gartner's 2027 CIO and Technology Executive Agenda (2,002 CIOs, fielded May–July 2026) finds the odds of any single use case succeeding are still one in five — and only 4% have a plan to redesign roles for a human-agent workforce. "Volume is not value," in Gartner's words. The operating model underneath the agents is the variable that moves it.

Gartner, October 2026

STAT 12

16%

Just 16% of enterprise AI deployments qualify as true agents

Menlo's bar: systems where the model plans, acts, observes feedback, and adapts. Most of what's labeled "agent" is still a fixed-sequence workflow — the buyer-side version of what Gartner calls "agent washing."

Menlo Ventures, December 2025

THE FRAMEWORK

The five pillars of *production-ready* agentic AI

Most statistics roundups organize by market size and hype. We organized this one around the five questions that decide whether an agent survives contact with real buyers — the same five questions wysdym is built to answer. The data that follows makes the case for each one.

PILLAR 01

Learning

Agents are only as good as the knowledge underneath them — and whether it compounds.

PILLAR 02

Skills

What agents can actually do — typed capabilities, not vague promises.

PILLAR 03

Connectivity

Agents that can't reach your stack can't do real work.

PILLAR 04

Governance

Autonomy without approvals is just risk with better marketing.

PILLAR 05

Observability

If you can't see what your agent did, you can't trust what it does next.

PILLAR 01

Learning & knowledge

An agent without your knowledge is a generic model with your logo on it. The data is blunt: fragmented, stale knowledge is the single biggest thing standing between GTM teams and agents that actually work.

STAT 13

95%

95% of organizations are getting zero return from GenAI — and the core barrier is learning

MIT Project NANDA's report puts it plainly: most systems "do not retain feedback, adapt to context, or improve over time." 66% of executives want AI that learns from feedback; 63% demand tools that retain context.

MIT Project NANDA, The GenAI Divide, July 2025 (PDF copy)

STAT 14

7%

Only 7% of companies have the data readiness required to scale advanced AI

Accenture's survey of executives at 2,000 companies in 15 countries finds 72% lack trusted data of the right quality with standardized governance to support advanced AI — and more than 80% delay, limit, or alter AI initiatives at least occasionally because of data-related risks. The model isn't the bottleneck. The knowledge is.

Accenture, AI-Ready Data, May 2026

STAT 15

60%

Sales reps spend 60% of their time on non-selling tasks

Hunting for the right deck, re-entering CRM notes, chasing internal approvals — most of a rep's week goes to everything except customers. The counterweight: 85% of reps with agents say AI frees them to focus on higher-value work.

Salesforce Sales Statistics, February 2026

STAT 16

84%

84% of data leaders say their data strategy needs a complete overhaul before their AI ambitions can succeed

70% believe their most valuable business insights sit inside the sliver of data that's inaccessible — siloed or unusable — and 89% of leaders with AI in production have already seen inaccurate or misleading outputs. That's the exact gap a structured knowledge layer exists to close.

Salesforce, State of Data & Analytics, November 2025

STAT 17

60%

60% of organizations that ignore data governance culture will fail to govern AI successfully by 2027

Gartner's March 2026 survey of 223 data and analytics leaders found cultural resistance, not funding, is the main reason governance initiatives fail (60% vs. 40%). Policies and tooling don't make knowledge trustworthy; the habits around it do. That's a knowledge-layer problem before it's a compliance one.

Gartner, September 2026

STAT 18

3.4×

Grounding an LLM in a knowledge graph lifted answer accuracy from 16% to 54%

The data.world AI Lab benchmark asked GPT-4 enterprise data questions: direct queries scored 16% accuracy; the same questions over a knowledge graph scored 54%. Structure isn't a nice-to-have — it's the accuracy mechanism.

Sequeda, Allemang & Jacob, arXiv, 2023

STAT 19

22–94%

Hallucination rates across 26 top models ranged from 22% to 94% on a new accuracy benchmark

Stanford's 2026 AI Index shows even frontier models fail unpredictably — in a separate test, DeepSeek R1's accuracy fell from over 90% to 14.4% when a false statement was framed as the user's own belief. Models with no source of truth to check against tell you what you want to hear.

Stanford HAI, 2026 AI Index, April 2026

STAT 20

70%

70% of enterprises will abandon agentic AI built by vendor forward-deployed engineering by 2028

Gartner's diagnosis: vendor engineers build it fast, but the customer never develops the internal capability to operate and evolve it — and fewer than 20% of those engagements ever feed what they learn back into the vendor's core product. Agents built for you, on a layer that doesn't learn from you, are a rental. The knowledge has to stay with the enterprise.

Gartner, September 2026

THE WYSDYM LENS

This is why wysdym is built around Cortex — a typed knowledge graph of your business, 39 GTM domains, self-learning — rather than a flat document store. Every agent on the operating layer reads from the same graph and writes what it learns back, so the next agent starts smarter than the last one. Knowledge in folders decays; a graph graded by deal outcomes compounds.

PILLAR 02

Skills & capabilities

"Agent" covers everything from a glorified FAQ to software that closes tickets end-to-end. The capability data shows what agents genuinely do well today — and where autonomy still breaks.

STAT 21

77.3%

AI agents' success rate on real-world terminal tasks jumped from 20% to 77.3% in a year

Stanford's 2026 AI Index also has agents solving cybersecurity problems 93% of the time, up from 15% in 2024. Capability is compounding fast — the constraint is moving elsewhere.

Stanford HAI, 2026 AI Index, April 2026

STAT 22

10:1

By 2028, AI agents will outnumber sellers 10 to 1 — yet fewer than 40% of sellers will say agents improved productivity

Gartner's warning to CSOs is agent sprawl: more digital activity, little improvement in seller impact. Agents "are only as effective as the systems they operate within," and Gartner predicts CSOs who overhaul data, automation, and user experience will be five times more likely to gain ROI from AI by 2028. Capabilities need to be scoped and wired into the workflow, not multiplied.

Gartner, July 2026

STAT 23

54%

54% of sellers have already used AI agents — nearly 9 in 10 plan to by 2027

Sellers expect agents to cut prospect research time by 34% and email drafting by 36%, per Salesforce's survey of 4,050 sales professionals.

Salesforce, State of Sales, February 2026

STAT 24

1.7×

Top-performing sales teams are 1.7x more likely to use agents for prospecting

And 94% of sales leaders with agents call them critical to meeting business demands. Agents are showing up first where revenue is measured.

Salesforce, State of Sales, February 2026

STAT 25

4.8 hrs

AI saves sellers 4.8 hours a week — but 72% of sales organizations fail to reinvest the time in high-value work

The teams that do reinvest it are 2.2x more likely to exceed customer-growth goals and 3.1x more likely to exceed lead-to-opportunity conversion goals, per Gartner's 2026 survey of 210 sales leaders. The skill isn't saving time; it's redeploying it.

Gartner, May 2026

STAT 26

83%

83% of marketers say customers expect two-way conversations — but 69% can't respond promptly

And 81% would trust AI to respond to customers to help them scale. The conversation gap is now the most quantified problem in marketing.

Salesforce, State of Marketing, February 2026

THE WYSDYM LENS

Capabilities should be typed, testable, and shared — not improvised per agent. On wysdym, skills are the verbs: a library of typed GTM capabilities any agent can invoke over MCP, and Plays chain them into routines where every action ties to a measurable deal outcome. That's how agent-vs-headcount math stops being a guess.

PILLAR 03

Connectivity & interoperability

An agent that can't reach your CRM, your content, and your calendar is a demo. 2025–2026 is when the industry converged on open protocols for connecting agents to the systems where work actually happens.

STAT 27

10,000+

The Model Context Protocol passed 10,000+ public servers and 97M+ monthly SDK downloads in its first year

MCP — adopted by ChatGPT, Gemini, Microsoft Copilot, Cursor, and VS Code — was donated to the Linux Foundation's new Agentic AI Foundation in December 2025. Agent-to-tool connectivity now has a standard.

Anthropic, December 2025

STAT 28

150+

150+ organizations now back the Agent2Agent (A2A) interoperability protocol — triple its launch roster

Launched by Google in April 2025 with 50+ supporters and now governed by the Linux Foundation, A2A reached production-ready status in under a year — SDKs in five languages, backing from AWS, Cisco, Google, IBM, Microsoft, Salesforce, SAP, and ServiceNow. Agents are becoming a network, not a feature.

The Linux Foundation, April 2026

STAT 29

5x+

AI inference costs per agentic workflow will rise more than fivefold through 2028

Gartner calls it the "inference paradox": per-token prices keep falling, but multistep agents consume more — and often more expensive — tokens, so total cost climbs anyway. Wiring the same integrations and retrieval separately into every agent is exactly the cost curve a shared connection layer flattens.

Gartner, August 2026

STAT 30

50%

50% of enterprise AI agents operate in isolated silos — and only 27% of apps are integrated

Salesforce's 11th Connectivity Benchmark (1,050 IT leaders, fielded October–November 2025) counts an average of 957 applications per enterprise, and 86% of IT leaders worry agents will add more complexity than value without proper integration. Connectivity isn't plumbing — it decides whether your agent can see the systems your revenue actually runs through.

Salesforce / MuleSoft, Connectivity Benchmark Report, February 2026

THE WYSDYM LENS

This is why wysdym is built on MCP — the protocol behind 10,000+ public servers and 97M+ monthly SDK downloads (stat 27). Bring any agent — Claude, OpenAI, LangGraph, or your own — and the Gateway, one MCP door to your stack, connects it to the systems your revenue runs through. Connections don't just feed answers; they feed your graph. Vendor-agnostic by design.

THE BET

The operating layer, *not the agent*

You bring the agent — Claude, OpenAI, LangGraph, or your own. wysdym brings what's underneath: shared graph memory, typed skills, connections into your stack, approval queues, and a feedback loop that learns from deal outcomes. The more agents you run, the smarter every one gets.

PILLAR 04

Governance & trust

The fastest way to kill an agent program is an agent that acts without guardrails. The trust data explains why buyers hesitate — and why the winners gate consequential actions instead of hoping for the best.

STAT 31

14%

Only 14% of teams ship AI agents with full security and IT approval

81% of teams have agents past the planning phase — in active testing or production — but just 14% go live with full sign-off from security and IT, and 88% of organizations report confirmed or suspected agent-related incidents. Adoption is outpacing control, and governance is the bottleneck. Survey of 900+ executives and practitioners.

Gravitee, State of AI Agent Security 2026

STAT 32

65%

65% of enterprises have seen an AI agent act outside its intended scope

And 29% took measurable business impact from it. The confidence gap is the tell: 94% of leaders trust their agents aren't over-provisioned, yet only a third actually enforce least-privilege access — and nearly half couldn't produce a complete 30-day audit trail. Trust without enforcement isn't governance.

EMA for Cequence Security, "Agents Without Guardrails," August 2026

STAT 33

40%

By 2027, 40% of enterprises will demote or decommission autonomous AI agents over governance gaps found only after production incidents

Gartner's May 2026 warning is specific: treating agent governance as binary — locked down or fully trusted — is the root cause of failure. Graduated autonomy wins.

Gartner, May 2026

STAT 34

63%

63% of leaders now require human validation of AI agent outputs — nearly triple a year ago

Human-in-the-loop went from afterthought to default in four quarters (22% in Q1 2025 → 63% in Q1 2026), and 91% say data security, privacy, and risk will influence their AI strategies over the next six months.

KPMG AI Quarterly Pulse, March 2026

STAT 35

1 in 4

Only one-quarter of leaders completely trust their AI systems — yet two-thirds have given AI write access to core systems

And more than four in five tech leaders expect autonomous agents to make decisions with material business impact within a year, per Kyndryl's survey of 1,100 business and technology leaders. Trust is trailing autonomy — the market is voting for governed autonomy.

Kyndryl People Readiness Report, June 2026

STAT 36

21%

71% of organizations expect to deploy agentic AI within 12 months — only 21% have agentic AI governance in place

Gartner's Q2 2026 survey of more than 2,000 CIOs and technology executives, unveiled at its IT Symposium/Xpo keynote, where Gartner told CIOs the challenge is now to compound value faster than risk. Deployment intent is running more than three times ahead of governance capability — and that gap is exactly where the demoted agents in stat 33 come from.

Gartner, October 2026

STAT 37

1 in 4

1 in 4 malicious breaches is now AI-enabled — costing an average of $6 million

That's roughly $1 million more than the $4.99 million global average, and the share of AI-enabled breaches rose 56% in a year. More than 20% of organizations reported a breach targeting AI models or applications. IBM and Ponemon studied breaches at 602 organizations between March 2025 and February 2026. Ungoverned AI isn't just a quality risk; it's a security line item.

IBM, Cost of a Data Breach Report 2026, July 2026

STAT 38

75%

AI agents will influence 75% of B2B purchase decisions in 2027

Forrester's 2027 B2B predictions: business buyers will increasingly deploy AI agents across the buying process, while truly autonomous buying stays concentrated in high-volume, low-risk, repeatable purchases. Forrester's prescription: give AI tools credible, consistent proof points they can index and validate. The next prospect evaluating you may be a machine checking your work.

Forrester, October 2026

THE WYSDYM LENS

Our rule is simple: every agent action visible, the consequential ones gated. On wysdym, agents write through approval queues — a human signs off before anything touches your CRM. Approvals aren't friction; they're what makes autonomy deployable. Teams shouldn't have to choose between an agent that does nothing and an agent they can't control.

PILLAR 05

Observability

Would you let a new hire touch every deal in your pipeline without ever reviewing the work? That's what an unobserved agent is — and once you're running several, the surface area only grows. The market is waking up to this, fast.

STAT 39

89%

89% of organizations run some observability on their agents — but only 62% can trace individual steps and tool calls

Among teams already in production it's 94% and 71.5%. The teams that ship treat visibility as non-negotiable, not nice-to-have.

LangChain, State of Agent Engineering (surveyed late 2025)

STAT 40

3 in 10

Roughly 3 in 10 agent teams aren't evaluating their agents at all

Only 52.4% run offline evals before deployment, and just 37.3% evaluate live traffic. Most agent failures aren't mysterious — they're unmeasured.

LangChain, State of Agent Engineering (surveyed late 2025)

STAT 41

15→50%

LLM observability investments will grow from 15% of GenAI deployments to 50% by 2028

Gartner ties the jump to explainable AI becoming a requirement for secure GenAI deployment. If you can't explain what an agent did, you can't defend letting it do it again.

Gartner, March 2026

STAT 42

+55%

Documented AI incidents hit a record 362 in 2025 — up 55% in one year

Stanford's AI Index tracks them through the AI Incident Database. More agents, more autonomy, more surface area — visibility is how you stay off this list.

Stanford HAI, 2026 AI Index, April 2026

STAT 43

54/yr

Enterprises average 54 AI agent incidents a year that require human correction

17% of those incidents were high severity, taking more than four hours to contain — and of those, 37% resulted in data exposure or security breaches and 33% caused cascading system failures. Organizations that build control into their AI systems deploy 16x more agents than those relying on manual governance.

IBM Institute for Business Value, June 2026

STAT 44

5%

5% of production LLM calls returned an error in February 2026

Datadog's telemetry from more than a thousand customers found 60% of those errors came from exceeded rate limits (by March the error rate was 2%) — and more than 70% of organizations now use three or more models. Real systems fail in boring ways. You need to see it happen.

Datadog, State of AI Engineering, April 2026

STAT 45

78%

78% of executives lack confidence they could pass an independent AI governance audit within 90 days

Nearly 3 in 4 organizations are giving agents access to their data and processes — but just 20% have a tested AI incident response plan. Auditability is the new uptime.

Grant Thornton, 2026 AI Impact Survey

THE WYSDYM LENS

Observability is how agents earn trust — and how they get smarter. wysdym is designed to trace every agent action and attribute it to deal outcomes: Findings spot what's drifting before deals stall, and everything observed flows back into the graph. Visibility doesn't just catch problems; it compounds learning.

SECTION 09

ROI, outcomes & what's next

The honest version: returns are real but unevenly distributed. The teams seeing ROI aren't the ones with the most pilots — they're the ones whose agents learn, connect, and stay governed.

STAT 46

37%

Only 37% of organizations attribute any EBIT impact to AI — unchanged from a year ago

Nearly nine in ten respondents report regular AI use and 44% say AI is scaling across their enterprise — yet AI high performers remain flat at about 6%. What sets them apart: nearly three-quarters of high performers have fundamentally redesigned workflows around AI, versus one-quarter of everyone else.

McKinsey, The State of AI in 2026, August 2026

STAT 47

7%

84% of finance organizations have implemented or plan to implement AI — but only 7% report high impact

Gartner's survey of 183 CFOs is the CFO-side version of the depth problem: near-universal adoption, single-digit transformation. The gap between the 84% and the 7% is an operating-model gap — compare stat 11 (13% of CIOs seeing significant value) and stat 12 (16% true agents).

Gartner, June 2026

STAT 48

44%

44% of CEOs struggle to demonstrate AI-driven financial returns to stakeholders

Yet 75% plan to increase technology investment, and 63% name radically redesigning the operating model as a top power move. Gartner's 2027 CEO Survey (203 CEOs and senior executives, April–May 2026) puts it plainly: the AI value problem won't be solved by "adding more AI to existing ways of working."

Gartner, October 2026

STAT 49

67%

67% of B2B buyers prefer a rep-free buying experience

And 45% used AI during a recent purchase. Your buyers brought agents to the table first — the question is whether the agents on your side are grounded, governed, and learning, or improvising in isolation.

Gartner, March 2026

STAT 50

7×

Contacting a web lead within an hour makes you ~7x more likely to qualify them

The classic HBR study (2011) is still the benchmark: 60x better than waiting 24+ hours — yet average response time was 42 hours, and 23% of companies never responded at all. Speed-to-lead remains the oldest argument for always-on agents — and for grounding them so the first touch is right, not just fast.

Harvard Business Review, 2011

STAT 51

61%

61% of CMOs have adapted content for machine readability — and 42% now monitor and correct AI misinformation about their brand

Gartner's survey of 408 senior marketing leaders (July–August 2026) shows marketing now designs for AI readers as well as human ones — even as 94% plan to increase investment in human touchpoints. When your buyer's research runs through an AI summary, your brand is only as accurate as what the machine can find.

Gartner, November 2026

STAT 52

60%

By 2028, 60% of brands will use agentic AI for one-to-one buyer interactions

Gartner calls it the end of channel-based marketing: instead of campaigns pushed through channels, agents handle individual conversations. GTM's next operating model is conversational.

Gartner, January 2026

THE BOTTOM LINE

What this means for GTM teams

Read all 52 together and one pattern keeps surfacing: capability stopped being the constraint. The operating model is.

Agent task performance nearly quadrupled in a year (stat 21) — yet 95% of organizations get zero return from GenAI (stat 13), only 14% of teams ship agents with full security approval (stat 31), and only a quarter of leaders completely trust their AI systems (stat 35). The teams winning aren't the ones with better models. Everyone has the same models.

What separates them maps cleanly to five pillars. They ground agents in structured, learning knowledge instead of flat documents (stats 13, 14, 18). They scope and wire skills into the workflow instead of multiplying agents (stat 22). They connect agents to

the systems where work actually happens (stats 27–30). They gate consequential actions with human judgment (stat 34). And they watch everything (stats 39–40).

For GTM teams, the urgency is sharper. 67% of your buyers prefer to buy without a rep (stat 49). They expect two-way conversations your team can't staff (stat 26). They reward whoever answers first (stat 50). Agents will do more and more of this work — so the question the data keeps asking isn't which agent you'll run. It's what your agents run on.

That's the bet behind wysdym: the operating layer, not the agent. Every team is buying agents; no one is building the layer underneath. You bring the agent — Claude, OpenAI, LangGraph, or your own. wysdym is the operating layer underneath: shared graph memory, typed skills, approval-gated writes, and a feedback loop that ties every agent action to deal outcomes — so the next agent on your stack starts smarter than the last one.

FAQ

Frequently asked questions

What is agentic AI?

AI systems that don't just generate answers — they plan and take actions toward goals: retrieving knowledge, using tools, and executing multi-step work with varying levels of autonomy. Menlo Ventures' working definition is a useful bar: a true agent plans, acts, observes feedback, and adapts. By that standard, only 16% of enterprise AI deployments qualify today (stat 12).

How is an AI agent different from a chatbot?

A scripted chatbot follows a decision tree and breaks the moment a buyer goes off-script. An agent reasons over knowledge and takes action — and a knowledge-grounded agent answers from your company's actual content, positioning, and intelligence, so the answers are yours rather than a generic model's. The difference is measurable: grounding answers in structured knowledge took accuracy from 16% to 54% in benchmark testing (stat 18).

How big is the agentic AI market in 2026?

Worldwide AI spending reaches $2.59 trillion in 2026 (Gartner), and 62% of organizations are building, deploying or developing agents (KPMG). On the agentic-specific slice: Gartner projects agentic AI could drive over $450 billion in enterprise application software revenue by 2035.

Why do most agentic AI projects fail?

Three patterns dominate the research. Knowledge: 95% of organizations get zero return from GenAI because systems don't learn or retain context (MIT Project NANDA), and only 7% of companies have the data readiness to scale advanced AI (Accenture). Governance: only 14% of teams ship agents with full security and IT approval, and 88% of organizations report agent-related incidents (Gravitee). Observability: roughly 3 in 10 teams don't evaluate their agents at all (LangChain). Failed agent programs almost never fail on model quality.

What should GTM leaders look for in the layer their agents run on?

Ask five questions. **Learning:** do agents run on your structured knowledge, and does it get smarter with every outcome? **Skills:** are capabilities typed and shared across agents — and honest about what they don't do? **Connectivity:** does one layer plug every agent into your CRM, content, and conversation tools? **Governance:** can you gate consequential writes behind human approval? **Observability:** can you trace every action and tie it back to deal outcomes?

What does wysdym do?

wysdym is the operating layer for agentic GTM — the layer underneath your agents, not another agent. It grounds every agent in your GTM truth, runs the motion under your governance, and gets sharper with every deal you close. Bring any agent (Claude, OpenAI, LangGraph, or custom), and wysdym supplies five pillars, all connected through the Gateway, one MCP door to your stack: **Cortex** (shared intelligence and memory — a typed knowledge graph of your business), **Skills** (what agents do — an open skill library any agent invokes over MCP), **Governance** (the rules on every action — per-agent permissions, human-in-the-loop, and receipts), **Observe** (which agents are actually working — outcome attribution to deal stages, with Findings that flag drift with the fix attached), and **Operator** (analyst-grade answers that act on your workflows). Your stack — Salesforce, HubSpot, Gong, Slack, Drive, Notion — is wired once through the Gateway, not per agent. The more agents you run on it, the smarter every one gets.

Is wysdym the same company as Wysdom.AI?

No. They are two unrelated companies with similar names. **wysdym** — spelled w-y-s-d-y-m — is the operating layer for agentic GTM, founded in 2025 in Toronto by Rob Catalano and Nadir Ebrahim, at wysdym.ai. **Wysdom.AI** — spelled w-y-s-d-o-m — is a conversational-AI and bot-analytics company acquired by Calabrio in January 2024. There is no affiliation, ownership, or shared history between them. If a search engine or AI assistant describes wysdym as a chatbot-analytics or contact-centre vendor, it has merged the two companies.

METHODOLOGY

How we compiled this

All 52 statistics on this page link to their original sources — analyst press releases, primary research reports, vendor surveys with disclosed methodology, peer-reviewed papers, and official announcements. We verified each figure against the original publication in November 2026, and where a widely-cited number is older than 2025 (like the HBR speed-to-lead study), we say so instead of pretending it's new.

None of the numbers on this page are wysdym's own. We'd rather show you the industry's real data than dress up our opinions as research. Where we editorialize, it's clearly labeled as "the wysdym lens."

Found an error or a fresher source? Tell us — we update this page as the research evolves.

PUT THE PILLARS TO WORK

Agents alone won't grow revenue.
Compounding intelligence will.

Any vendor can sell you an agent. None of them make your other agents better, act on your terms, or tell you which ones are working. That's where wysdym comes in — **the operating layer underneath**, where every action compounds into a revenue advantage.

---

wysdym

The operating layer for agentic GTM. All third-party statistics remain the property of their respective publishers; each is linked to its original source. Compiled July 2026 · Updated November 2026.
